

**In the claims:**

Presented below are the claims, as amended, with changes entered and not marked.

---

1

1 1. (Currently Amended) A system comprising a central processing unit (CPU)  
2 including power management logic to enable the CPU to ~~operate in~~ execute a first  
3 quantity of instructions per cycle ~~execution mode~~ whenever the temperature of the CPU  
4 exceeds ~~the~~ a predetermined threshold and to ~~operate in~~ execute a second quantity of  
5 instructions per cycle ~~execution mode~~ whenever the temperature of the CPU is below the  
6 predetermined threshold, ~~wherein the CPU executes a first quantity of instructions per~~  
7 ~~cycle in the first execution mode and executes a second quantity of instructions per cycle~~  
8 ~~in the second execution mode.~~

1 2. (Original) The system of claim 1 wherein the power management logic comprises:  
2 a thermal sensor;  
3 a digital filter coupled to the thermal sensor; and  
4 an interrupt generating hardware coupled to the digital filter, wherein the interrupt  
5 generating hardware generates a first interrupt whenever the temperature of the CPU  
6 exceeds the predetermined threshold and generates a second interrupt whenever the  
7 temperature of the CPU is below the predetermined threshold.

1 3. (Original) The system of claim 2 wherein the power management logic  
2 further comprises an analog to digital converter coupled between the thermal sensor and  
3 the digital filter.

1 4. (Original) The system of claim 2 further comprising programmable array  
2 logic (PAL), wherein the PAL includes an interrupt handler for receiving the first and  
3 second interrupts.

1 5. (Original) The system of claim 4 wherein the power management logic  
2 further comprises:

3 an instruction execution unit coupled to the interrupt handler; and

4 an artificial activity generator coupled to the interrupt handler.

B1  
1 6. (Previously Presented) The system of claim 5 wherein the instruction  
2 execution unit executes six instructions per cycle in the first execution mode whenever  
3 the die temperature is below the predetermined threshold temperature and executes one  
4 instruction per cycle in the second execution whenever the die temperature is above the  
5 predetermined threshold temperature.

1 7. (Original) The system of claim 5 wherein the artificial activity generator  
2 causes the CPU artificial activity generator to suspend artificial activity within the CPU  
3 whenever the die temperature is above the predetermined threshold temperature.

1 8. (Currently Amended) A method comprising:  
2 determining whether the temperature of a central processing unit (CPU) exceeds a  
3 predetermined threshold;  
4 executing a first quantity of instructions per cycle ~~generating a first interrupt~~ if the  
5 temperature of the CPU exceeds the predetermined threshold; and

6 executing a second quantity of instructions per cycle if the temperature of the  
7 CPU is below the predetermined threshold.

8 ~~transitioning from a first execution mode to a second execution mode, wherein the~~  
9 ~~CPU executes a first quantity of instructions per cycle in the first execution mode and~~  
10 ~~executes a second quantity of instructions per cycle in the second execution mode.~~

1 9. (Currently Amended) The method of claim 8 further comprising wherein the  
2 process of transitioning from the first execution mode to the second execution mode  
3 comprises:

4 generating a first interrupt if the temperature of the CPU exceeds the  
5 predetermined threshold;

6 interrupting an artificial activity mode; and

7 transitioning from a full instruction execution mode to a single instruction  
8 execution mode.

1 10. (Original) The method of claim 9 further comprising:  
2 suspending the execution of code at the CPU after generating the first interrupt;  
3 and

4 resuming the execution of code at the CPU after transitioning to the single  
5 instruction execution mode.

1 11. (Original) The method of claim 10 further comprising:  
2 determining whether the temperature of the CPU exceeds the predetermined  
3 threshold after transitioning to the single instruction execution mode; and

terminating the operation of the CPU if the temperature of the CPU exceeds the predetermined threshold after transitioning to the single instruction execution mode.

12. (Original) The method of claim 10 further comprising:

determining whether the temperature of the CPU exceeds the predetermined threshold after transitioning to the single instruction execution mode; and

generating a second interrupt if the CPU does not exceed the predetermined threshold after transitioning to the single instruction execution mode.

13. (Original) The method of claim 12 further comprising transitioning from the second execution mode to the first execution mode.

14. (Original) The method of claim 13 wherein the process of transitioning from the second execution mode to the first execution mode comprises:

resuming the artificial activity mode; and

transitioning from the single instruction execution mode to the full instruction execution mode.

15. (Original) The method of claim 12 wherein the first interrupt is a high temperature interrupt and the second interrupt is a normal temperature interrupt.

16. (Previously Presented) A central processing unit (CPU) comprising:

a thermal sensor; and

an instruction execution unit to generate a first quantity of instructions per cycle in a first execution mode whenever the thermal sensor measures temperature exceeding a predetermined threshold and to generate a second quantity of instructions per cycle in a

6 second execution mode whenever the thermal sensor measures temperature below the  
7 predetermined threshold.

1 17. (Previously Presented) The CPU of claim 16 further comprising:  
2 interrupt generating hardware coupled to generate a first interrupt whenever the  
3 thermal sensor measures a temperature that exceeds the predetermined threshold and  
4 generates a second interrupt whenever the thermal sensor measures a temperature below  
5 the predetermined threshold.

B 1 18. (Previously Presented) The CPU of claim 17 further comprising an  
2 artificial activity generator.

1 19. (Previously Presented) The CPU of claim 18 wherein the artificial activity  
2 generator causes the artificial activity generator to suspend artificial activity within the  
3 CPU whenever the die temperature is above the predetermined threshold temperature.

1 20. (Currently Amended) Power management logic comprising:  
2 a thermal sensor; and  
3 an instruction execution unit to generate a first quantity of instructions per cycle  
4 in a first execution mode whenever the thermal sensor measures a temperature exceeding  
5 a predetermined threshold and to generate a second quantity of instructions per cycle in a  
6 second execution mode whenever the thermal sensor measures temperature below the  
7 predetermined threshold; and  
8 interrupt generating hardware to generate a first interrupt whenever the thermal  
9 sensor measures a temperature that exceeds the predetermined threshold and generates a

10 second interrupt whenever the thermal sensor measures a temperature below the  
11 predetermined threshold.

1 21. (Currently Amended) The power management logic of claim 20 further  
2 comprising:

3 ~~interrupt generating hardware to generate a first interrupt whenever the thermal~~  
4 ~~sensor measures a temperature that exceeds the predetermined threshold and generates a~~  
5 ~~second interrupt whenever the thermal sensor measures a temperature below the~~  
6 ~~predetermined threshold~~

7 an analog to digital converter coupled to the thermal sensor.

1 22. (Previously Presented) The power management logic of claim 20 further  
2 comprising an artificial activity generator.

1 23. (Previously Presented) The power management logic of claim 22 wherein  
2 the artificial activity generator causes the artificial activity generator to suspend artificial  
3 activity within the CPU whenever the die temperature is above the predetermined  
4 threshold temperature.

1 24. (Currently Amended) The power management logic of claim 21 further  
2 comprising:

3 ~~an analog to digital converter coupled to the thermal sensor; and~~

4 a digital filter coupled to the analog to digital converter and the interrupt  
5 generating hardware.
